Kegwords: Bernoulli polynomial Buler polynomial Hankel determinant Orthogonal polynomial ABSTRACT

Using continued fraction expansions of certain polygramma functions as a main tool, we find orthogonal polynomials with respect to the odd-rinder Bermoulli polynomials $B_{B+1}(z)$ and the Euler polynomials $B_{B+1}(z)$, for $\nu=0,1,2$. In the process we also determine the corresponding Jacobi continued fractions (or L-fractions) and Hankel determinants. In all these cases the Hankel determinants are polynomials in x which factor completely over the rationals.

HANKEL DETERMINANTS OF SHIFTED SEQUENCES OF BERNOULLI AND EULER NUMBERS

KARL DILCHER AND LIN JIU*

Amstract. Hankel determinants of sequences related to Demonilli and Euler munders have been studied before, and mumerous identities are known. However, when a sequence is shifted by one unit, the situation often changes significantly. In this paper we use classical orthogonal polynomials and related methods to prove a general result concerning thankel determinants or shifted sequences. We then apply this result to the control of the control of the control of the control of the related to Bernoulli and Euler numbers, one of which concerns Euler polynomials.

• A Hankel matrix $(M_{i,j})$ is a square matrix with constant skew diagonals, i.e., $M_{i,j} = M_{i',j'}$ whenever i + j = i' + j':

$$\begin{pmatrix} s_0 & s_1 & s_2 & \cdots & s_n \\ s_1 & s_2 & s_3 & \cdots & s_{n+1} \\ s_2 & s_3 & s_4 & \cdots & s_{n+2} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ s_n & s_{n+1} & s_{n+2} & \cdots & s_{2n} \end{pmatrix}$$

- Letting $\{s_n\}_{n\geq 0}$ be a sequence in a field \mathbb{K} , one may define its associated Hankel matrices by $(s_{i+j})_{0\leq i,j\leq n}$.
- We are interested in the **determinant** of these matrices.

Example 1:

• Bernoulli numbers $B_n = (1, -\frac{1}{2}, \frac{1}{6}, 0, -\frac{1}{30}, 0, \frac{1}{42}, 0, -\frac{1}{30}, 0, \frac{5}{66}, \ldots)$:

$$\sum_{n>0} B_n \frac{t^n}{n!} = \frac{t}{e^t - 1}.$$

Hankel determinants:

$$\det\left(1\right) = 1, \ \det\left(\begin{array}{cc} 1 & -\frac{1}{2} \\ -\frac{1}{2} & \frac{1}{6} \end{array}\right) = -\frac{1}{12}, \ \det\left(\begin{array}{cc} 1 & -\frac{1}{2} & \frac{1}{6} \\ -\frac{1}{2} & \frac{1}{6} & 0 \\ \frac{1}{6} & 0 & -\frac{1}{30} \end{array}\right) = -\frac{1}{540}, \ \dots$$
$$1, -\frac{1}{12}, -\frac{1}{540}, \frac{1}{42000}, \frac{1}{3215625}, -\frac{4}{623959875}, \dots$$

Al-Salam and Carlitz (1959):

$$\det_{0 \le i,j \le n} (B_{i+j}) = (-1)^{\binom{n+1}{2}} \prod_{k=1}^{n} \frac{(k!)^6}{(2k)!(2k+1)!}.$$

Example 2:

• Euler numbers $E_n = (1, 0, -1, 0, 5, 0, -61, 0, 1385, 0, -50521, \ldots)$:

$$\sum_{n\geq 0} E_n \frac{t^n}{n!} = \frac{2}{e^t + e^{-t}}.$$

Hankel determinants:

$$1, -1, -4, 144, 82944, -1194393600, \dots$$

Al-Salam and Carlitz (1959):

$$\det_{0 \le i,j \le n} (E_{i+j}) = (-1)^{\binom{n+1}{2}} \prod_{k=1}^{n} (k!)^{2}.$$

• *q-integers*: For $m \in \mathbb{Z}$,

$$[m]_q:=\frac{1-q^m}{1-q}.$$

• *q-factorials*: For $M \in \mathbb{N}$,

$$[M]_q! := \prod_{m=1}^M [m]_q.$$

• *q-Pochhammer symbols*: For $N \in \mathbb{N} \cup \{\infty\}$,

$$(A; q)_{N} := \prod_{k=0}^{N-1} (1 - Aq^{k}),$$

$$(A, B, \dots, C; q)_{N} := (A; q)_{N} (B; q)_{N} \dots (C; q)_{N}.$$

• *q-Bernoulli numbers* β_n (Carlitz, 1948):

$$\beta_n := \frac{1}{(1-q)^n} \sum_{k=0}^n (-1)^k \binom{n}{k} \frac{k+1}{[k+1]_q}.$$

Alternatively, they can be recursively defined by $\beta_0=1$ and for $n\geq 1$,

$$\sum_{k=0}^{n} \binom{n}{k} q^{k+1} \beta_k - \beta_n = \begin{cases} 1, & \text{if } n = 1, \\ 0, & \text{if } n \ge 2. \end{cases}$$

Nombres de q-Bernoulli-Carlitz et fractions continues

<u>F Chapoton</u>, <u>J Zeng</u> - Journal de théorie des nombres de Bordeaux, 2017 - numdam.org Carlitz a introduit vers 1950 des q-analogues des nombres de Bernoulli. On obtient une représentation de ces q-analogues (ainsi que de variantes décalées) comme moments de ...

☆ Save 57 Cite Cited by 7 Related articles ♦

Hankel determinants for q-Bernoulli numbers:

$$\det_{0 \le i,j \le n} (\beta_{i+j}) = (-1)^{\binom{n+1}{2}} q^{\binom{n+1}{3}} \prod_{k=1}^{n} \frac{([k]_q!)^6}{[2k]_q![2k+1]_q!}.$$

THE STARTING POINT

1. The Carlitz β

Carlitz [1, 2] generated the Bernoulli numbers to the sequence $\beta_n,$ by the recurrence:

$$\sum_{k=0}^{n} {n \choose k} \beta_k q^{k+1} - \beta_m = \begin{cases} 1, & m = 1; \\ 0, & m > 1, \end{cases}$$

with also the value $\beta_0 = 1$.

Definition 1. The q-bracket is defined by

$$[x]_q:=\frac{1-q^x}{1-q},$$

for all $x \in \mathbb{R}$ and q > 0. The q-factorial is then defined by

$$[k]_q! := [k]_q[k-1]_q \cdots [1]_q$$
.

Conjecture 2.

$$H_n(\beta_k) = (-1)^{\binom{n+1}{2}} q^{\frac{(n-1)n(n+1)}{6}} \prod_{k=1 \atop k=1}^n [k]_q^{6(n+1-k)} \\ \prod_{k=1 \atop k=1}^n [k]_q^{2n+2-k}.$$

From Lin, Mar 14, 2023

From Shane on Apr 04, 2023.

Throughout, let us use Carlitz's q-Bernoulli numbers β_k given by $\beta_0=1$ and for $n\geq 1$,

$$\sum_{k=0}^{n} \binom{n}{k} \beta_k q^{k+1} - \beta_n = \begin{cases} 1 & \text{if } n = 1, \\ 0 & \text{if } n \ge 2. \end{cases}$$

"Need to Prove" 1.

$$\sum_{k\geq 0} \beta_k x^k = \frac{\beta_0}{1 + a_0 x - \frac{b_1 x^2}{1 + a_1 x - \frac{b_2 x^2}{1 + a_2 x - \dots}}},$$
(1)

where

$$a_n = \frac{1}{(1+q^n)(1+q^{n+1})} \left(-\frac{(1-q^n)(1-q^{n+1})}{1-q} + 2q^n \right), \qquad (2)$$

$$b_n = -\frac{q^{n-1}(1-q^n)^6}{(1-q)^2(1-q^{2n-1})(1-q^{2n})^2(1-q^{2n+1})}. (3)$$

Déjà vu!

Nombres de q-Bernoulli-Carlitz et fractions continues

F Chapoton, J Zeng

Journal de théorie des nombres de Bordeaux, 2017 - numdam.org

Resume

Carlitz a introduit vers 1950 des q-analogues des nombres de Bernoulli. On obtient une représentation de ces q-analogues (ainsi que de variantes décalées) comme moments de certains polynômes orthogonaux. Ceci donne aussi des factorisations des déterminants de Hankel des nombres de q-Bernoulli, ainsi que des fractions continues pour leurs séries génératrices. Certains de ces résultats sont des q-analogues d'énoncés connus pour les nombres de Bernoulli, mais d'autres sont sans version classique.

Abstract. q-Bernoulli-Carlitz Numbers and continuous fractions.

Théorème 4.2. On a, pour les matrices d'indices $0 \le i, j \le n-1$,

(4.7)
$$\det (\beta_{i+j})_{i,j} = (-1)^{\binom{n}{2}} q^{\binom{n}{3}} \prod_{i=1}^{n-1} \frac{[i]!_q^6}{[2i]!_q [2i+1]!_q},$$

• *q-Euler numbers* ϵ_n (Carlitz, 1948):

$$\epsilon_n := \frac{1}{(1-q)^n} \sum_{k=0}^n (-1)^k \binom{n}{k} \frac{1+q}{1+q^{k+1}}.$$

Alternatively, they can be recursively defined by $\epsilon_0 = 1$ and for $n \ge 1$,

$$\sum_{k=0}^{n} \binom{n}{k} q^{k+1} \epsilon_k + \epsilon_n = 0.$$

• At the $q \to 1$ limit, ϵ_n reduces to

$$1, -\frac{1}{2}, 0, \frac{1}{4}, 0, -\frac{1}{2}, 0, \frac{17}{8}, 0, -\frac{31}{2}, \dots,$$

which is identical to $E_n(0)$ rather than $2^n E_n(\frac{1}{2})$, the Euler numbers E_n . Here the *Euler polynomials* $E_n(x)$ are given by

$$\sum_{n\geq 0} E_n(x) \frac{t^n}{n!} = \frac{2e^{xt}}{e^t + 1}.$$

Theorem (C.-Jiu, 2023)

$$\begin{split} &\det_{0 \leq i,j \leq n} (\epsilon_{i+j}) \\ &= \frac{(-1)^{\binom{n+1}{2}} q^{\frac{1}{4}\binom{2n+2}{3}}}{(1-q)^{n(n+1)}} \prod_{k=1}^{n} \frac{(q^2,q^2;q^2)_k}{(-q,-q^2,-q^2,-q^3;q^2)_k}, \\ &\det_{0 \leq i,j \leq n} (\epsilon_{i+j+1}) \\ &= \frac{(-1)^{\binom{n+2}{2}} q^{\frac{1}{4}\binom{2n+4}{3}}}{(1-q)^{n(n+1)}(1+q^2)^{n+1}} \prod_{k=1}^{n} \frac{(q^2,q^4;q^2)_k}{(-q^2,-q^3,-q^3,-q^4;q^2)_k}, \\ &\det_{0 \leq i,j \leq n} (\epsilon_{i+j+2}) \\ &= \frac{(-1)^{\binom{n+2}{2}} q^{\frac{1}{4}\binom{2n+4}{3}}(1+q)^n (1-(-1)^n q^{(n+2)^2})}{(1-q)^{n(n+1)}(1+q^2)^{2(n+1)}(1+q^3)^{n+1}} \prod_{k=1}^{n} \frac{(q^4,q^4;q^2)_k}{(-q^3,-q^4,-q^4,-q^5;q^2)_k}. \end{split}$$

ADVANCED DETERMINANT CALCULUS

C. KRATTENTHALER!

Institut für Mathematik der Universität Wien. Strudlhofgasse 4, A-1090 Wien, Austria. E-mail: kratt@pap.univie.ac.at WWW: http://radon.mat.univie.ac.at/People/kratt

Dedicated to the pioneer of determinant evaluations (among many other things). George Andrews

ABSTRACT. The purpose of this article is threefold. First, it provides the reader with a few useful and efficient tools which should enable her/him to evaluate nontrivial determinants for the case such a determinant should appear in her/his research. Second, it lists a number of such determinants that have been already evaluated, together with explanations which tell in which contexts they have appeared. Third, it points out references where further such determinant evaluations can be found.

Advanced determinant calculus: A complement

C. Krattenthaler

Submitted by R.A. Brualdi

Abstract

Hankel determinants

This is a complement to my previous article "Advanced Determinant Calculus" [C. Krattenthaler, Advanced determinant calculus, Séminaire Lotharingien Combin. 42 (1999) ("The Andrews Festschrift"), Article B42q, 67 pp.]. In the present article, I share with the reader my experience of applying the methods described in the previous article in order to solve a particular problem from number theory [G. Almkvist, C. Krattenthaler, J. Petersson, Some new formulas for π. Experiment, Math. 12 (2003) 441-456l. Moreover, I add a list of determinant evaluations which I consider as interesting, which have been found since the appearance of the previous article, or which I failed to mention there, including several conjectures and open problems.

Jacobi continued fractions (a.k.a. J-fractions):

Fact (Heilermann)

Let $\{\mu_k\}_{k\geq 0}$ be a sequence such that its generating function $\sum_{k\geq 0}\mu_k x^k$ has the J-fraction expression

$$\sum_{k\geq 0} \mu_k x^k = \frac{\mu_0}{1 + a_0 x - \frac{b_1 x^2}{1 + a_1 x - \frac{b_2 x^2}{1 + a_2 x - \dots}}}.$$

Then for $n \ge 0$,

$$\det_{0 \le i,j \le n} (\mu_{i+j}) = \mu_0^{n+1} b_1^n b_2^{n-1} \cdots b_{n-1}^2 b_n.$$

Jacobi continued fractions (a.k.a. J-fractions):

Fact (Heilermann (continued...))

Further, define $\{p_n(z)\}_{n\geq 0}$ a family of polynomials given by a three-term recursive relation for $n\geq 1$,

$$p_{n+1}(z) = (a_n + z)p_n(z) - b_n p_{n-1}(z),$$

with initial conditions $p_0(z) = 1$ and $p_1(z) = a_0 + z$. Then

$$\det_{0 \le i, j \le n} (\mu_{i+j+1}) = \det_{0 \le i, j \le n} (\mu_{i+j}) \cdot (-1)^{n+1} p_{n+1}(0).$$

Orthogonal polynomials: A family of polynomials $\{p_n(z)\}_{n\geq 0}$ with $p_n(z)$ of degree n is called *orthogonal* if there is a linear functional L on the space of polynomials in z such that $L\big(p_m(z)p_n(z)\big)=\delta_{m,n}\sigma_n$ where $\delta_{m,n}$ is the Kronecker delta and $\{\sigma_n\}_{n\geq 0}$ is a fixed nonzero sequence.

 $\textbf{\it Orthogonal polynomials} \Leftrightarrow \textbf{\it Three-term recurrences:}$

Fact (Favard, Stieltjes)

Let $\{p_n(z)\}_{n\geq 0}$ be a family of monic polynomials with $p_n(z)$ of degree n. Then they are orthogonal if and only if there exist sequences $\{a_n\}_{n\geq 0}$ and $\{b_n\}_{n\geq 1}$ with $b_n\neq 0$ such that $p_0(z)=1$, $p_1(z)=a_0+z$, and for $n\geq 1$,

$$p_{n+1}(z) = (a_n + z)p_n(z) - b_n p_{n-1}(z).$$

Orthogonal polynomials \Rightarrow *J-fractions*:

Fact

Let L be an associated linear functional for a family of orthogonal monic polynomials $\{p_n(z)\}_{n\geq 0}$ with $p_n(z)$ of degree n. Then

$$\sum_{k\geq 0} L(z^k) x^k = \frac{L(z^0)}{1 + a_0 x - \frac{b_1 x^2}{1 + a_1 x - \frac{b_2 x^2}{1 + a_2 x - \dots}}},$$

where $\{a_n\}_{n\geq 0}$ and $\{b_n\}_{n\geq 1}$ are given by the associated three-term recurrence.

How to evaluate Hankel determinants:

- STEP 1: Guess the *J*-fraction expression
- STEP 2: Formulate the associated orthogonal polynomials
- STEP 3: Determine a suitable linear functional
- STEP 4: Check orthogonality under this linear functional

STEP 1: Guess the J-fraction expression.

$$\begin{array}{l} A \\ B \\ \\ \text{Out[89]=} \end{array} \left\{ \begin{array}{l} \frac{q}{1+q^2} \,, \, \frac{-1-q+2\,q^3+q^4+q^5}{(1+q^2)\,\,(1+q^4)} \,, \, \frac{-1-q-q^2-q^3+2\,q^5+q^6+q^7+q^8+q^9}{(1+q^2)\,\,(1+q^4)\,\,(1-q^2+q^4)} \,, \\ \\ \frac{-1-q-q^2-q^3-q^4-q^5+2\,q^7+q^8+q^9+q^{18}+q^{11}+q^{12}+q^{13}}{(1+q^2)\,\,(1-q^2+q^4)\,\,(1+q^8)} \,, \\ \\ \frac{-1-q-q^2-q^3-q^4-q^5-q^6-q^7+2\,q^9+q^{18}+q^{11}+q^{12}+q^{13}+q^{14}+q^{15}+q^{16}+q^{17}}{(1+q^2)\,\,(1+q^8)\,\,(1-q^2+q^4-q^6+q^8)} \,, \\ \\ \text{Out[70]=} \end{array} \left\{ -\frac{q}{(1+q^2)^{\,2}\,\,(1-q+q^2)} \,, \, -\frac{q^3\,\,(1+q^2)^{\,2}}{(1-q+q^2)\,\,(1+q^4)^{\,2}\,\,(1-q+q^2-q^3+q^4)} \,, \\ \\ -\frac{q^5\,\,(1-q+q^2)^{\,2}\,\,(1+q+q^2)^{\,2}}{(1+q^2)^{\,2}\,\,(1-q^2+q^4)^{\,2}\,\,(1-q+q^2-q^3+q^4)^{\,2}\,\,(1-q+q^2-q^3+q^4-q^5+q^6)} \,, \\ \\ -\frac{q^7\,\,(1+q^2)^{\,2}\,\,(1+q^4)^{\,2}}{(1-q+q^2)\,\,(1-q^3+q^6)^{\,2}\,\,(1-q+q^2-q^3+q^4-q^5+q^6)\,\,(1+q^8)^{\,2}} \,, \\ \\ -\left(\left(q^9\,\,(1-q+q^2-q^3+q^4)^{\,2}\,\,(1+q+q^2-q^3+q^4-q^5+q^6)\,\,(1+q^8)^{\,2}} \,, \\ \\ -\left(\left(q^9\,\,(1-q+q^2-q^3+q^4)^{\,2}\,\,(1-q+q^2-q^3+q^4-q^5+q^6-q^7+q^8-q^9+q^{18})\,\,)\right) \right) \,, \end{array} \right.$$

STEP 1: Guess the J-fraction expression.

Guess(!)

Let $\ell \in \{0,1\}$. Then

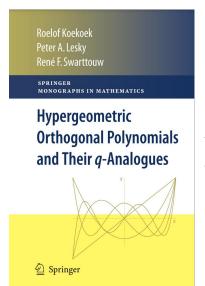

$$\sum_{k\geq 0} \epsilon_{k+\ell} x^k \stackrel{?}{=} \frac{\epsilon_{\ell}}{1 + a_{\ell,0} x - \frac{b_{\ell,1} x^2}{1 + a_{\ell,1} x - \frac{b_{\ell,2} x^2}{1 + a_{\ell,2} x - \dots}}},$$

where

$$\begin{split} \mathbf{a}_{\ell,n} &= \frac{q^{2n+\ell}(1+q)(1+q^\ell)}{(1-q)(1+q^{2n+\ell})(1+q^{2n+\ell+2})} - \frac{1}{1-q}, \\ \mathbf{b}_{\ell,n} &= -\frac{q^{2n+2\ell-1}(1-q^{2n})(1-q^{2n+2\ell})}{(1-q)^2(1+q^{2n+\ell-1})(1+q^{2n+\ell})^2(1+q^{2n+\ell+1})}. \end{split}$$

Proof

STEP 2: Formulate the associated orthogonal polynomials.

R. Koekoek, P. A. Lesky, and R. F. Swarttouw, Hypergeometric orthogonal polynomials and their q-analogues, Springer-Verlag, Berlin, 2010.

STEP 2: Formulate the associated orthogonal polynomials.

■ Big q-Jacobi polynomials:

$$\mathcal{J}_{\ell,\mathit{n}}(\mathit{z}) := {}_{3}\phi_{2}\left(\begin{matrix} q^{-\mathit{n}}, -q^{\mathit{n}+\ell+1}, \mathit{z} \\ q^{\ell+1}, 0 \end{matrix}; q, q\right).$$

Theorem

Define

$$\mathcal{P}_{\ell, \mathbf{n}}(\mathbf{z}) := \frac{(-1)^{\mathbf{n}} (q^{\ell+1}; q)_{\mathbf{n}}}{q^{\mathbf{n}} (1-q)^{\mathbf{n}} (-q^{\mathbf{n}+\ell+1}; q)_{\mathbf{n}}} {}_{3}\phi_{2} \begin{pmatrix} q^{-\mathbf{n}}, -q^{\mathbf{n}+\ell+1}, q(1-(1-q)\mathbf{z}) \\ q^{\ell+1}, 0 \end{pmatrix}; q, q \end{pmatrix}.$$

We have $\mathcal{P}_{\ell,0}(z) = 1$, $\mathcal{P}_{\ell,1}(z) = a_{\ell,0} + z$, and for $n \ge 1$,

$$\mathcal{P}_{\ell,n+1}(z) = (a_{\ell,n} + z)\mathcal{P}_{\ell,n}(z) - b_{\ell,n}\mathcal{P}_{\ell,n-1}(z).$$

S. Chern (Wien)

STEP 3: Determine a suitable linear functional.

Want to study the linear function $\boldsymbol{\Phi}$ with

$$\Phi(\mathbf{z}^n)=\epsilon_n.$$

 ${\mathbb F}$ Choose a "nice" basis for the vector space of polynomials over ${\mathbb Q}(q)$:

$$\left\{ \begin{bmatrix} n,z\\n \end{bmatrix}_q \right\}_{n\geq 0},$$

where (cf. Chapoton-Essouabri, 2015)

$$\begin{bmatrix} m, z \\ n \end{bmatrix}_{q} := \frac{1}{[n]_{q}!} \prod_{k=m-n+1}^{m} ([k]_{q} + q^{k}z).$$

S. Chern (Wien)

Proof

STEP 3: Determine a suitable linear functional.

Let Φ be the linear functional on $\mathbb{Q}(q)[z]$ given by

$$\Phi\left(\begin{bmatrix} n,z\\n\end{bmatrix}_q\right):=\frac{1}{(-q^2;q)_n}\qquad (n\geq 0).$$

<u>Lem</u>ma

For $0 \le m \le n$,

$$\Phi\left(\begin{bmatrix} m,z\\n\end{bmatrix}_q\right) = \frac{(-1)^{n-m}q^{n-m}}{(-q^2;q)_n}.$$

Lemma

For $n \geq 0$,

$$\Phi\left(\begin{bmatrix}n+1,z\\n\end{bmatrix}_q\right) = \frac{1+q}{q} - \frac{1}{q(-q^2;q)_n}.$$

STEP 3: Determine a suitable linear functional.

Theorem

For any $P(z) \in \mathbb{Q}(q)[z]$,

$$q\Phi(P(1+qz)) + \Phi(P(z)) = (1+q)P(0).$$

Theorem

For n > 0,

$$\Phi(z^n) = \epsilon_n.$$

Proof. We first notice that $\Phi(z^0)=\Phi(1)=1=\epsilon_0$. Now for $n\geq 1$, we apply the above theorem with $P(z)=z^n$, and derive that

$$q\Phi((1+qz)^n)+\Phi(z^n)=0,$$

namely,

$$\sum_{k=0}^{n} \binom{n}{k} q^{k+1} \Phi(z^k) + \Phi(z^n) = 0.$$

This recursive relation for $\Phi(z^n)$ is identical to that for $\epsilon_n!!!$

STEP 4: Check orthogonality under this linear functional.

Let $\ell \in \{0,1\}$. We define two linear functionals Φ_{ℓ} on $\mathbb{Q}(q)[z]$ by

$$\Phi_{\ell}(\mathbf{z}^n) := \Phi(\mathbf{z}^{n+\ell}) \qquad (n \ge 0).$$

Theorem

Let $\ell \in \{0,1\}$. The family of monic polynomials $\{\mathcal{P}_{\ell,n}(z)\}_{n\geq 0}$ is orthogonal under the linear functional Φ_{ℓ} .

Show that for $\ell \in \{0,1\}$, the identity $\Phi_{\ell}\big(\mathcal{P}_{\ell,n}(\mathbf{z})\big) = 0$ holds whenever $n \geq 1$:

$$egin{aligned} \mathcal{P}_{0,n}(z) &= rac{(-1)^n (q;q)_n}{q^n (1-q)^n (-q^{n+1};q)_n} \sum_{k=0}^n rac{q^k (q^{-n},-q^{n+1};q)_k}{(q;q)_k} iggl[k,z \ k iggr]_q, \ z \cdot \mathcal{P}_{1,n}(z) &= rac{(-1)^n (q^2;q)_n}{q^n (1-q)^n (-q^{n+2};q)_n} \sum_{k=0}^n rac{q^k (q^{-n},-q^{n+2};q)_k}{(q;q)_k} iggl[k,z \ k+1 iggr]_q. \end{aligned}$$

Question A: Families of q-Hankel determinants?

Note that

$$\mathcal{P}_{\ell,n}(z) = \frac{(-1)^n}{q^n(1-q)^n} \widetilde{\mathcal{J}}_{\ell,n} ((q^2-q)z+q),$$

where $\widetilde{\mathcal{J}}_{\ell,n}(z)$ are normalizations of the big q-Jacobi $\mathcal{J}_{\ell,n}(z)$ as monic polynomials:

$$\widetilde{\mathcal{J}}_{\ell,n}(z) := \frac{(q^{\ell+1};q)_n}{(-q^{n+\ell+1};q)_n} \mathcal{J}_{\ell,n}(z),$$

Theorem (C.-Jiu, 2023)

For each nonnegative integer ℓ , define a sequence $\{\xi_{\ell,n}\}_{n\geq 0}$ by

$$\xi_{\ell,n} := \frac{q^{(\ell+1)n}(-q;q)_n}{(-q^{\ell+2};q)_n}.$$

Then

$$\det_{0 \leq i, j \leq n} (\xi_{\ell, i + j}) = (-1)^{\binom{n+1}{2}} q^{2\binom{n+2}{3} + (2\ell+1)\binom{n+1}{2}} \prod_{k=1}^{n} \frac{(q^2, q^{2\ell+2}; q^2)_k}{(-q^{\ell+1}, -q^{\ell+2}, -q^{\ell+2}, -q^{\ell+3}; q^2)_k}.$$

27 / 34

• Bernoulli polynomials $B_n(x)$ and Euler polynomials $E_n(x)$:

$$\sum_{n\geq 0} B_n(x) \frac{t^n}{n!} = \frac{te^{xt}}{e^t-1} \qquad \text{and} \qquad \sum_{n\geq 0} E_n(x) \frac{t^n}{n!} = \frac{2e^{xt}}{e^t+1}.$$

In partucular,

$$B_n(x) = \sum_{k=0}^n \binom{n}{k} B_k x^{n-k}$$
 and $E_n(x) = \sum_{k=0}^n \binom{n}{k} \frac{E_k}{2^k} x^{n-k}$.

• Invariance of Hankel determinants under the binomial transform: For every $n \ge 0$, define

$$s_n(x) := \sum_{k=0}^n \binom{n}{k} s_k x^{n-k}.$$

Then

$$\det_{0\leq i,j\leq n}(s_{i+j}) = \det_{0\leq i,j\leq n}(s_{i+j}(x)).$$

Trivial determinant evaluations(!):

$$\det_{0 \le i,j \le n} (B_{i+j}(x)) = (-1)^{\binom{n+1}{2}} \prod_{k=1}^{n} \frac{(k!)^{6}}{(2k)!(2k+1)!},$$
$$\det_{0 \le i,j \le n} (E_{i+j}(x)) = (-\frac{1}{4})^{\binom{n+1}{2}} \prod_{k=1}^{n} (k!)^{2},$$

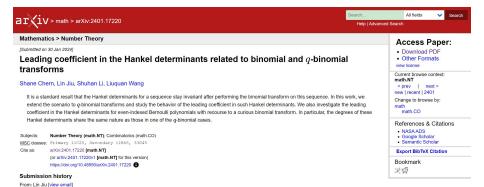

Dilcher–Jiu (2021):

$$\det_{0 \le i,j \le n} \left(B_{2(i+j)}(\frac{x+1}{2}) \right) = ???,$$

$$\det_{0 \le i,j \le n} \left(E_{2(i+j)}(\frac{x+1}{2}) \right) = (-1)^{\binom{n+1}{2}} \prod_{k=1}^{n} \left(\frac{k^2(x^2 - (2k-1)^2)}{4} \right)^{n-k+1},$$

$$\det_{0 \le i,j \le n} \left(B_{2(i+j)+1}(\frac{x+1}{2}) \right) = (-1)^{\binom{n+1}{2}} \left(\frac{x}{2} \right)^{n+1} \prod_{k=1}^{n} \left(\frac{k^4(x^2 - k^2)}{4(2k-1)(2k+1)} \right)^{n-k+1},$$

$$\det_{0 \le i,j \le n} \left(E_{2(i+j)+1}(\frac{x+1}{2}) \right) = (-1)^{\binom{n+1}{2}} \left(\frac{x}{2} \right)^{n+1} \prod_{k=1}^{n} \left(\frac{k^2(x^2 - 4k^2)}{4} \right)^{n-k+1}.$$

Theorem (C.-Jiu-Li-Wang, 2024)

For every $n \ge 0$, $\det_{0 \le i,j \le n} \left(B_{2(i+j)}(\frac{x+1}{2})\right)$ is a polynomial in x of degree n(n+1) with leading coefficient

$$\left[x^{n(n+1)}\right] \det_{0 \le i,j \le n} \left(B_{2(i+j)}\left(\frac{x+1}{2}\right)\right) = (-1)^{\binom{n+1}{2}} \prod_{j=1}^{n} \frac{(j!)^6}{(2j)!(2j+1)!}.$$

• It is notable that the Hankel determinant $\det_{0 \le i,j \le n} \left(B_{2(i+j)}(\frac{x+1}{2}) \right)$ is a linear combination of the terms

$$B_{2j_0}\left(\frac{1+x}{2}\right)B_{2(1+j_1)}\left(\frac{1+x}{2}\right)\cdots B_{2(n+j_n)}\left(\frac{1+x}{2}\right)$$

with j_0, j_1, \ldots, j_n a permutation of $0, 1, \ldots, n$. Here, each term is of degree $\sum_{i=0}^n 2(i+j_i) = 2n(n+1)$. However, our result states that the degree of the Hankel determinant is n(n+1), which is only half of the above terms, thereby indicating abundant cancelations of higher powers of x in this determinant expansion.

Question C: q-Binomial transform?

• Consider the q-binomial transform

$$\widetilde{\alpha}_n(x) := \sum_{k=0}^n q^{\binom{k}{2}} \begin{bmatrix} n \\ k \end{bmatrix}_q \alpha_k x^{n-k}.$$

- We no longer have invariance of Hankel determinants under this q-binomial transform.
- There is a "half the degree" phenomenon.

Theorem (C.-Jiu-Li-Wang, 2024)

For every $n \ge 0$, $\det_{0 \le i,j \le n} (\widetilde{\alpha}_{i+j}(x))$ is a polynomial in x of degree $\frac{n(n+1)}{2}$ with leading coefficient

$$\left[x^{\frac{n(n+1)}{2}}\right] \det_{0 \leq i,j \leq n} (\widetilde{\alpha}_{i+j}(x)) = \alpha_0 \alpha_1 \cdots \alpha_n (-1)^{\binom{n+1}{2}} q^{2\binom{n+1}{3}} \prod_{j=1}^n (1-q^j)^{n+1-j}.$$

Question C: q-Binomial transform?

• Special choices of α ?

Theorem (C.-Jiu-Li-Wang, 2024)

Choose the sequence $\alpha_k^{u,v}:=q^{-\binom{k}{2}}(u;q)_k\,v^k$ with u and v indeterminates so as to let

$$\widetilde{\alpha}_{k}^{u,v}(x) := \sum_{\ell=0}^{k} \begin{bmatrix} k \\ \ell \end{bmatrix}_{q} (u;q)_{\ell} v^{\ell} x^{k-\ell} = \sum_{\ell=0}^{k} \begin{bmatrix} k \\ \ell \end{bmatrix}_{q} (u;q)_{k-\ell} v^{k-\ell} x^{\ell}.$$

Then

$$\det_{0 \le i, j \le n} (\widetilde{\alpha}_{i+j}^{u,v}(x)) = v^{\binom{n+1}{2}} q^{\binom{n+1}{3}} \prod_{j=1}^{n} (uvq^{j-1} - x)^{n+1-j} (u, q; q)_{n+1-j}.$$
